

Assignment - Decision Trees and Random Forests

In this assignment, you'll continue building on the previous assignment to predict the price of a house using information like its location, area, no. of rooms etc. You'll use the dataset from the [House Prices - Advanced Regression Techniques](#) competition on [Kaggle](#).

We'll follow a step-by-step process:

1. Download and prepare the dataset for training
2. Train, evaluate and interpret a decision tree
3. Train, evaluate and interpret a random forest
4. Tune hyperparameters to improve the model
5. Make predictions and save the model

As you go through this notebook, you will find a ??? in certain places. Your job is to replace the ??? with appropriate code or values, to ensure that the notebook runs properly end-to-end and your machine learning model is trained properly without errors.

Guidelines

1. Make sure to run all the code cells in order. Otherwise, you may get errors like `NameError` for undefined variables.
2. Do not change variable names, delete cells, or disturb other existing code. It may cause problems during evaluation.
3. In some cases, you may need to add some code cells or new statements before or after the line of code containing the ???.
4. Since you'll be using a temporary online service for code execution, save your work by running `jovian.commit` at regular intervals.
5. Review the "Evaluation Criteria" for the assignment carefully and make sure your submission meets all the criteria.
6. Questions marked (**Optional**) will not be considered for evaluation and can be skipped. They are for your learning.
7. It's okay to ask for help & discuss ideas on the [community forum](#), but please don't post full working code, to give everyone an opportunity to solve the assignment on their own.

Important Links:

- Make a submission here: <https://jovian.ai/learn/machine-learning-with-python-zero-to-gbms/assignment/assignment-2-decision-trees-and-random-forests>

- Ask questions, discuss ideas and get help here: <https://jovian.ai/forum/c/zero-to-gbms/gbms-assignment-2/99>
- Review this Jupyter notebook: <https://jovian.ai/aakashns/sklearn-decision-trees-random-forests>

How to Run the Code and Save Your Work

Option 1: Running using free online resources (1-click, recommended): The easiest way to start executing the code is to click the **Run** button at the top of this page and select **Run on Binder**. This will set up a cloud-based Jupyter notebook server and allow you to modify/execute the code.

Option 2: Running on your computer locally: To run the code on your computer locally, you'll need to set up [Python](#), download the notebook and install the required libraries. Click the **Run** button at the top of this page, select the **Run Locally** option, and follow the instructions.

Saving your work: You can save a snapshot of the assignment to your [Jovian](#) profile, so that you can access it later and continue your work. Keep saving your work by running `jovian.commit` from time to time.

```
!pip install jovian --upgrade --quiet
```

68.6/68.6 kB 7.9 MB/s eta 0:00:00

Preparing metadata (setup.py) ... done

Building wheel for uuid (setup.py) ... done

```
import jovian
```

```
jovian.commit(project='python-random-forests-assignment', privacy='secret')
```

[jovian] Detected Colab notebook...

[jovian] `jovian.commit()` is no longer required on Google Colab. If you ran this notebook from Jovian,

then just save this file in Colab using `Ctrl+S/Cmd+S` and it will be updated on Jovian. Also, you can also delete this cell, it's no longer necessary.

Let's begin by installing the required libraries.

```
!pip install opendatasets scikit-learn plotly folium --upgrade --quiet
```

15.3/15.3 MB 102.9 MB/s eta

0:00:0000:0100:01

```
!pip install pandas numpy matplotlib seaborn --quiet
```

Download and prepare the dataset for training

```
import os
from zipfile import ZipFile
```

```
from urllib.request import urlretrieve
```

```
dataset_url = 'https://github.com/JovianML/opendatasets/raw/master/data/house-prices-act  
urlretrieve(dataset_url, 'house-prices.zip')
```

```
with ZipFile('house-prices.zip') as f:  
    f.extractall(path='house-prices')
```

```
os.listdir('house-prices')
```

```
['data_description.txt', 'train.csv', 'test.csv', 'sample_submission.csv']
```

```
import pandas as pd
```

```
pd.options.display.max_columns = 200
```

```
pd.options.display.max_rows = 200
```

```
prices_df = pd.read_csv('house-prices/train.csv')
```

```
prices_df
```

Let's save our work before continuing.

```
jovian.commit()
```

[jovian] Detected Colab notebook...
[jovian] jovian.commit() is no longer required on Google Colab. If you ran this notebook from Jovian, then just save this file in Colab using Ctrl+S/Cmd+S and it will be updated on Jovian. Also, you can also delete this cell, it's no longer necessary.

Decision Tree

QUESTION 1: Train a decision tree regressor using the training set.

```
from sklearn.tree import DecisionTreeRegressor
```

```
# Create the model
tree = DecisionTreeRegressor(random_state=42)
```

```
# Fit the model to the training data
# Fit the model to the training data
tree.fit(train_inputs, train_targets)
```

```
DecisionTreeRegressor(random_state=42)
```

In a Jupyter environment, please rerun this cell to show the HTML representation or trust the notebook.
On GitHub, the HTML representation is unable to render, please try loading this page with nbviewer.org.
DecisionTreeRegressor

```
DecisionTreeRegressor(random_state=42)
```

Let's save our work before continuing.

```
jovian.commit()
```

[jovian] Detected Colab notebook...

QUESTION 2: Generate predictions on the training and validation sets using the trained decision tree, and compute the RMSE loss.

```
from sklearn.metrics import mean_squared_error
```

```
tree_train_preds = tree.predict(train_inputs)
```

```
tree_train_rmse = mean_squared_error(train_targets, tree_train_preds)
```

```
tree_val_preds = tree.predict(val_inputs)
```

```
tree_val_rmse = mean_squared_error(val_targets, tree_val_preds)
```

```
print('Train RMSE: {}, Validation RMSE: {}'.format(tree_train_rmse, tree_val_rmse))
```

Train RMSE: 0.0, Validation RMSE: 1429057134.4054794

Let's save our work before continuing.

```
jovian.commit()
```

[jovian] Detected Colab notebook...

[jovian] jovian.commit() is no longer required on Google Colab. If you ran this notebook from Jovian, then just save this file in Colab using Ctrl+S/Cmd+S and it will be updated on Jovian. Also, you can also delete this cell, it's no longer necessary.

QUESTION 3: Visualize the decision tree (graphically and textually) and display feature importances as a graph. Limit the maximum depth of graphical visualization to 3 levels.

```
import matplotlib.pyplot as plt
from sklearn.tree import plot_tree, export_text
import seaborn as sns
```

```
sns.set_style('darkgrid')
%matplotlib inline
```

```
plt.figure(figsize=(30,15))
```

```
# Visualize the tree graphically using plot_tree
plot_tree(tree)
```

```

[jovian] Detected Colab notebook...

[jovian] jovian.commit() is no longer required on Google Colab. If you ran this notebook from Jovian, then just save this file in Colab using Ctrl+S/Cmd+S and it will be updated on Jovian. Also, you can also delete this cell, it's no longer necessary.

Random Forests

QUESTION 4: Train a random forest regressor using the training set.

```
from sklearn.ensemble import RandomForestRegressor
```

```
# Create the model  
rf1 = RandomForestRegressor()
```

```
# Fit the model  
rf1.fit(train_inputs, train_targets)
```

```
RandomForestRegressor()
```

In a Jupyter environment, please rerun this cell to show the HTML representation or trust the notebook. On GitHub, the HTML representation is unable to render, please try loading this page with nbviewer.org.

```
RandomForestRegressor
```

```
RandomForestRegressor()
```

```
print(rf1.score(train_inputs, train_targets))
```

```
0.9784194861448834
```

```
print(rf1.score(val_inputs, val_targets))
```

```
0.8917368397989932
```

Let's save our work before continuing.

```
jovian.commit()
```

[jovian] Detected Colab notebook...
[jovian] jovian.commit() is no longer required on Google Colab. If you ran this notebook from Jovian, then just save this file in Colab using Ctrl+S/Cmd+S and it will be updated on Jovian. Also, you can also delete this cell, it's no longer necessary.

QUESTION 5: Make predictions using the random forest regressor.

```
rf1_train_preds = rf1.predict(train_inputs)
```

```
rf1_train_rmse = mean_squared_error(train_targets, rf1_train_preds)
```

```
rf1_val_preds = rf1.predict(val_inputs)
```

```
rf1_val_rmse = mean_squared_error(val_targets, rf1_val_preds)
```

```
print('Train RMSE: {}, Validation RMSE: {}'.format(rf1_train_rmse, rf1_val_rmse))
```

```
Train RMSE: 131024905.76241902, Validation RMSE: 758416896.190975
```

Let's save our work before continuing.

```
jovian.commit()
```

[jovian] Detected Colab notebook...

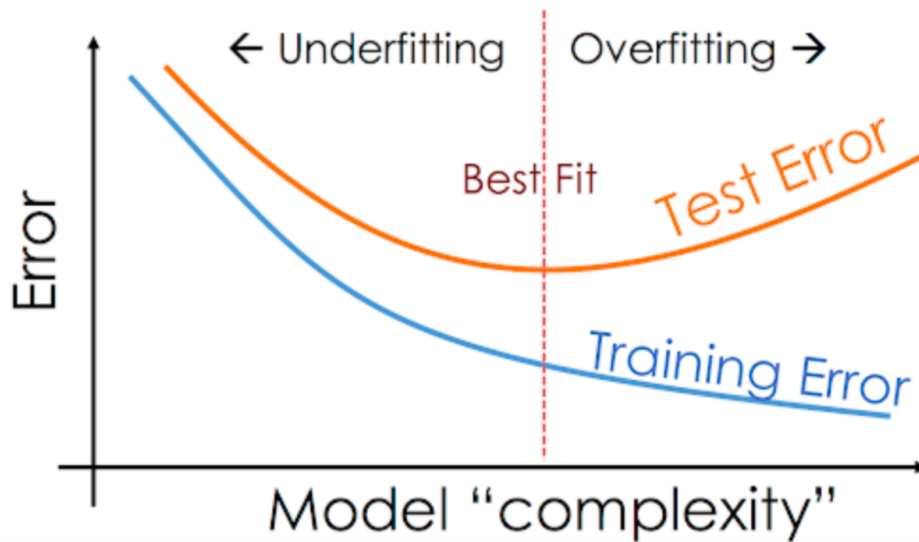

[jovian] jovian.commit() is no longer required on Google Colab. If you ran this notebook from Jovian,

then just save this file in Colab using Ctrl+S/Cmd+S and it will be updated on Jovian. Also, you can also delete this cell, it's no longer necessary.

Hyperparameter Tuning

Let us now tune the hyperparameters of our model. You can find the hyperparameters for

RandomForestRegressor here: <https://scikit-learn.org/stable/modules/generated/sklearn.ensemble.RandomForestRegressor.html>

Hyperparameters are use

Let's define a helper function `test_params` which can test the given value of one or more hyperparameters.

```
def test_params(**params):
    model = RandomForestRegressor(random_state=42, n_jobs=-1, **params).fit(train_input
    train_rmse = mean_squared_error(model.predict(train_inputs), train_targets, squared
    val_rmse = mean_squared_error(model.predict(val_inputs), val_targets, squared=False
    return train_rmse, val_rmse
```

It can be used as follows:

```
test_params(n_estimators=20, max_depth=20)
```

```
(13776.89957127333, 28886.033523273858)
```

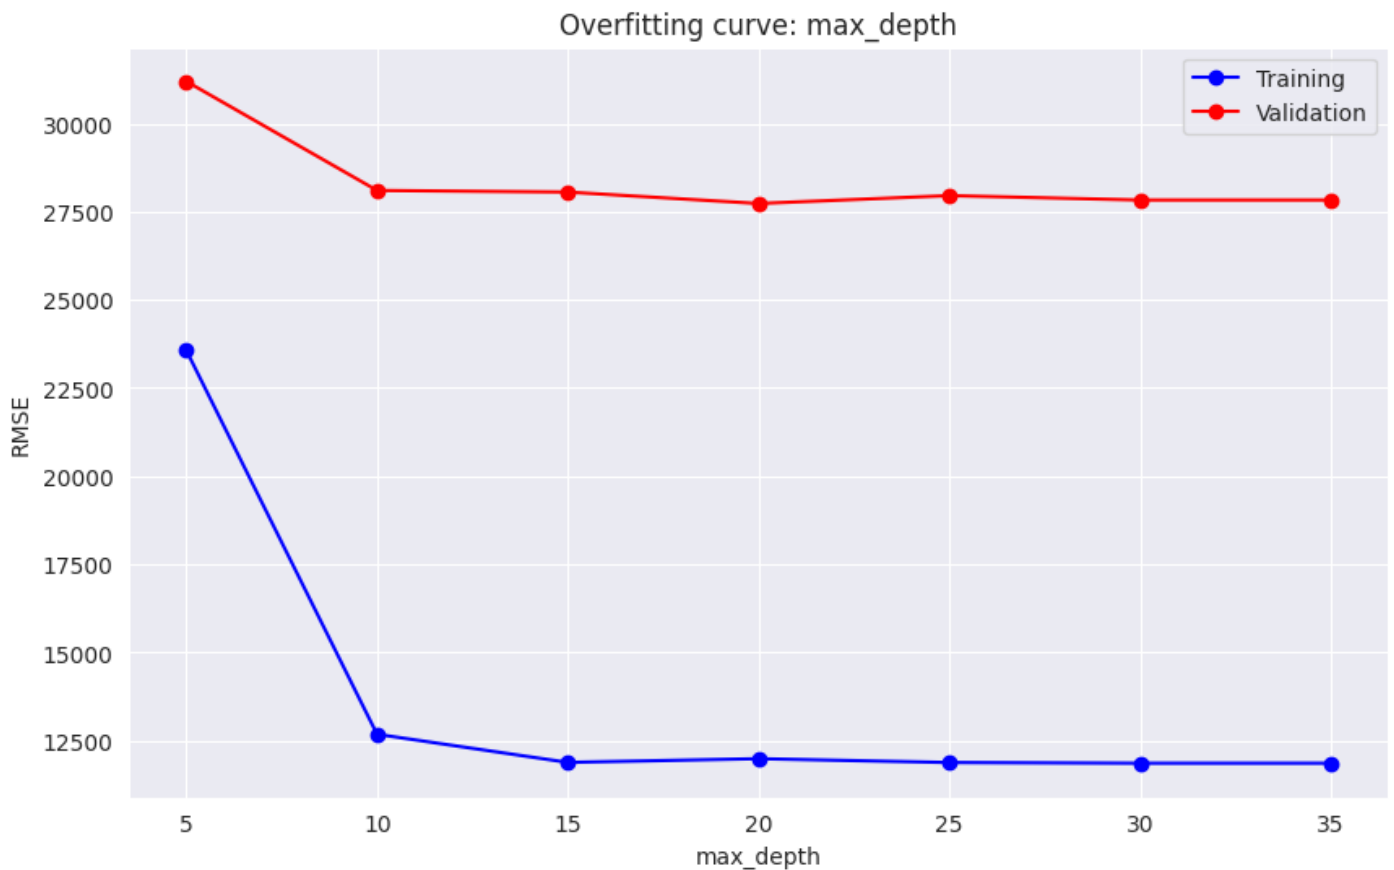

```
test_params(n_estimators=50, max_depth=10, min_samples_leaf=4, max_features=0.4)
```

```
(20490.359632429263, 29804.931642791606)
```

Let's also define a helper function to test and plot different values of a single parameter.

```
def test_param_and_plot(param_name, param_values):
    train_errors, val_errors = [], []
    for value in param_values:
        params = {param_name: value}
        train_rmse, val_rmse = test_params(**params)
        train_errors.append(train_rmse)
        val_errors.append(val_rmse)
    plt.figure(figsize=(10,6))
    plt.title('Overfitting curve: ' + param_name)
    plt.plot(param_values, train_errors, 'b-o')
    plt.plot(param_values, val_errors, 'r-o')
    plt.xlabel(param_name)
    plt.ylabel('RMSE')
    plt.legend(['Training', 'Validation'])
```

```
test_param_and_plot('max_depth', [5, 10, 15, 20, 25, 30, 35])
```

From the above graph, it appears that the best value for `max_depth` is around 20, beyond which the model starts to overfit.

Let's save our work before continuing.

```
jovian.commit()
```

[jovian] Detected Colab notebook...

[jovian] `jovian.commit()` is no longer required on Google Colab. If you ran this notebook from Jovian,

then just save this file in Colab using Ctrl+S/Cmd+S and it will be updated on Jovian.

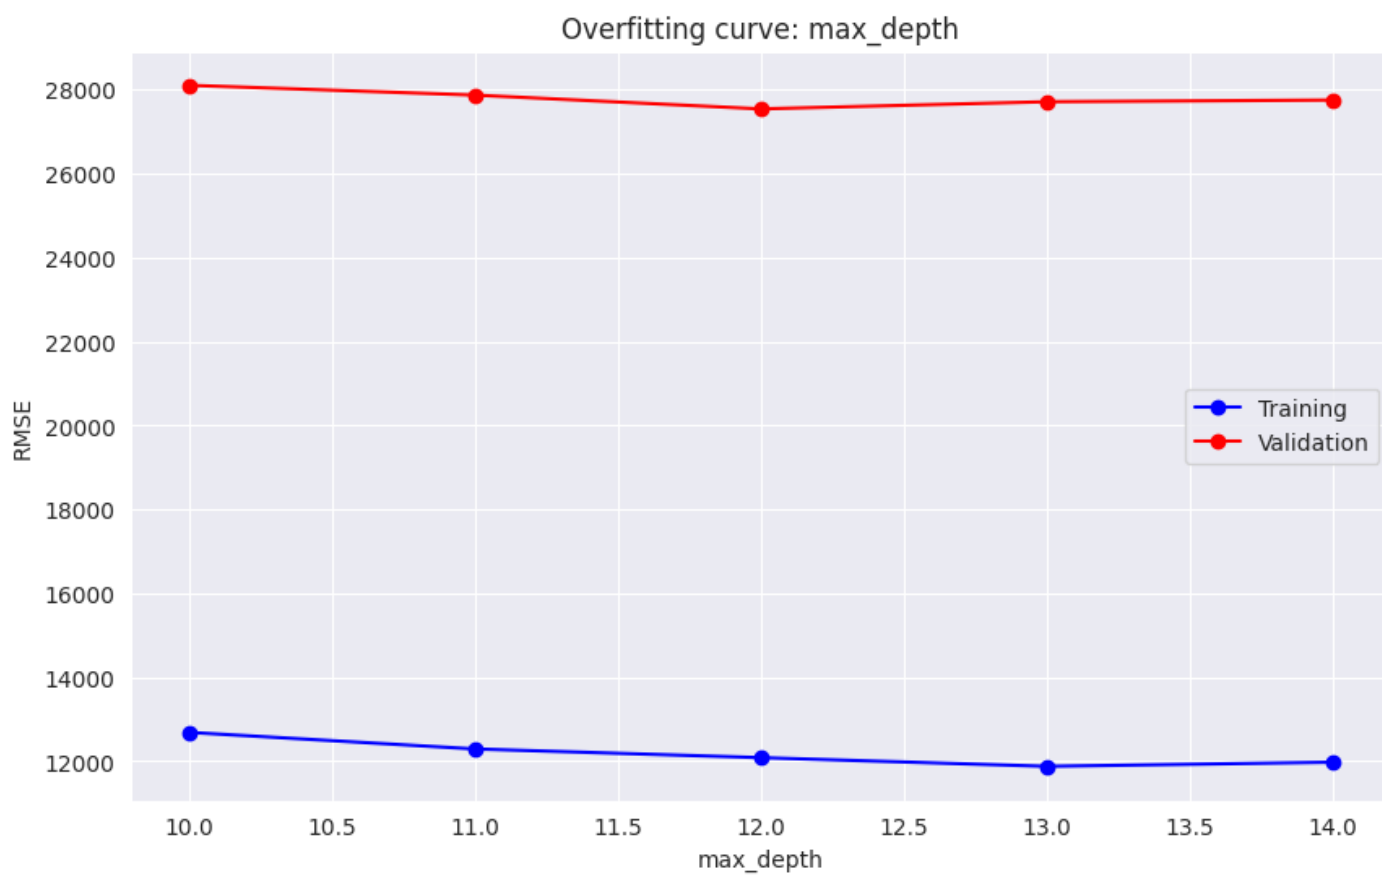

Also, you can also delete this cell, it's no longer necessary.

QUESTION 6: Use the `test_params` and `test_param_and_plot` functions to experiment with different values of the hyperparameters like `n_estimators`, `max_depth`, `min_samples_split`, `min_samples_leaf`, `min_weight_fraction_leaf`, `max_features`, `max_leaf_nodes`, `min_impurity_decrease`, `min_impurity_split` etc. You can learn more about the hyperparameters here: <https://scikit-learn.org/stable/modules/generated/sklearn.ensemble.RandomForestRegressor.html>

```
test_param_and_plot('n_estimators', range(10, 15))
```

```
test_param_and_plot('max_depth', range(10, 15))
```

Let's save our work before continuing.

```
jovian.commit()
```

[jovian] Detected Colab notebook...

[jovian] jovian.commit() is no longer required on Google Colab. If you ran this notebook from Jovian,

then just save this file in Colab using Ctrl+S/Cmd+S and it will be updated on Jovian. Also, you can also delete this cell, it's no longer necessary.

Training the Best Model

QUESTION 7: Train a random forest regressor model with your best hyperparameters to minimize the validation loss.

```
# Create the model with custom hyperparameters
rf2 = RandomForestRegressor(
    n_estimators=22,
    max_depth=100,
    max_leaf_nodes=10
)
```

```
# Train the model
rf2.fit(train_inputs, train_targets)
```

```
RandomForestRegressor(max_depth=100, max_leaf_nodes=10, n_estimators=22)
```

In a Jupyter environment, please rerun this cell to show the HTML representation or trust the notebook. On GitHub, the HTML representation is unable to render, please try loading this page with nbviewer.org.

RandomForestRegressor

```
RandomForestRegressor(max_depth=100, max_leaf_nodes=10, n_estimators=22)
```

Let's save our work before continuing.

```
jovian.commit()
```

[jovian] Detected Colab notebook...

[jovian] jovian.commit() is no longer required on Google Colab. If you ran this notebook from Jovian,

then just save this file in Colab using Ctrl+S/Cmd+S and it will be updated on Jovian. Also, you can also delete this cell, it's no longer necessary.

QUESTION 8: Make predictions and evaluate your final model. If you're unhappy with the results, modify the hyperparameters above and try again.

```
rf2_train_preds = rf2.predict(train_inputs)
```

```
rf2_train_rmse = mean_squared_error(train_targets, rf2_train_preds)
```

```
rf2_val_preds = rf2.predict(val_inputs)
```

```
print(rf2.score(val_inputs, val_targets))
```

0.8154028355077315

```
rf2_val_rmse = mean_squared_error(val_targets, rf2_val_preds)
```

```
print('Train RMSE: {}, Validation RMSE: {}'.format(rf2_train_rmse, rf2_val_rmse))
```

Train RMSE: 1012987797.5373459, Validation RMSE: 1271053743.0157743

Let's also view and plot the feature importances.

```
rf2_importance_df = pd.DataFrame({
    'feature': train_inputs.columns,
    'importance': rf2.feature_importances_
}).sort_values('importance', ascending=False)
```

```
rf2_importance_df
```

	feature	importance
3	OverallQual	0.703987
15	GrLivArea	0.114524
13	2ndFlrSF	0.034905
11	TotalBsmntSF	0.026750
25	GarageCars	0.024560
...
119	RoofStyle_Flat	0.000000
120	RoofStyle_Gable	0.000000
121	RoofStyle_Gambrel	0.000000
122	RoofStyle_Hip	0.000000
303	SaleCondition_Partial	0.000000

304 rows × 2 columns

```
sns.barplot(data=rf2_importance_df, x='importance', y='feature')
```

```
<Axes: xlabel='importance', ylabel='feature'>
```

Let's save our work before continuing.

```
jovian.commit()
```

Make a Submission

To make a submission, just execute the following cell:

```
jovian.submit('zerotogbms-a2')
```

You can also submit your Jovian notebook link on the assignment page: <https://jovian.ai/learn/machine-learning-with-python-zero-to-gbms/assignment/assignment-2-decision-trees-and-random-forests>

Make sure to review the evaluation criteria carefully. You can make any number of submissions, and only your final submission will be evaluated.

Ask questions, discuss ideas and get help here: <https://jovian.ai/forum/c/zero-to-gbms/gbms-assignment-2/99>

NOTE: The rest of this assignment is optional.

Making Predictions on the Test Set

Let's make predictions on the test set provided with the data.

```
test_df = pd.read_csv('house-prices/test.csv')
```

test_df

1458	2919	187741.866657

1459 rows × 2 columns

Let's replace the values of the `SalePrice` column with our predictions.

```
submission_df['SalePrice'] = test_preds
```

Let's save it as a CSV file and download it.

```
submission_df.to_csv('submission.csv', index=False)
```

```
from IPython.display import FileLink
FileLink('submission.csv') # Doesn't work on Colab, use the file browser instead to download
```

[submission.csv](#)

We can now submit this file to the competition: <https://www.kaggle.com/c/house-prices-advanced-regression-techniques/submissions>

Name	Submitted	Wait time	Execution time	Score
submission.csv	just now	1 seconds	0 seconds	0.14842

Complete

(OPTIONAL) QUESTION: Submit your predictions to the competition. Experiment with different models, feature engineering strategies and hyperparameters and try to reach the top 10% on the leaderboard.

Let's save our work before continuing.

```
jovian.commit()
```

[jovian] Detected Colab notebook...

[jovian] jovian.commit() is no longer required on Google Colab. If you ran this notebook from Jovian,

then just save this file in Colab using Ctrl+S/Cmd+S and it will be updated on Jovian. Also, you can also delete this cell, it's no longer necessary.

Making Predictions on Single Inputs

```
def predict_input(model, single_input):  
    input_df = pd.DataFrame([single_input])  
    input_df[numeric_cols] = imputer.transform(input_df[numeric_cols])  
    input_df[numeric_cols] = scaler.transform(input_df[numeric_cols])  
    input_df[encoded_cols] = encoder.transform(input_df[categorical_cols].values)  
    return model.predict(input_df[numeric_cols + encoded_cols])[0]
```

```
sample_input = { 'MSSubClass': 20, 'MSZoning': 'RL', 'LotFrontage': 77.0, 'LotArea': 93  
'Street': 'Pave', 'Alley': None, 'LotShape': 'IR1', 'LandContour': 'Lvl', 'Utilities':  
'LotConfig': 'Inside', 'LandSlope': 'Gtl', 'Neighborhood': 'NAMES', 'Condition1': 'Nor  
'BldgType': '1Fam', 'HouseStyle': '1Story', 'OverallQual': 4, 'OverallCond': 5, 'YearB  
'YearRemodAdd': 1959, 'RoofStyle': 'Gable', 'RoofMatl': 'CompShg', 'Exterior1st': 'Ply  
'Exterior2nd': 'Plywood', 'MasVnrType': 'None', 'MasVnrArea': 0.0, 'ExterQual': 'TA', 'Ex  
'Foundation': 'CBlock', 'BsmtQual': 'TA', 'BsmtCond': 'TA', 'BsmtExposure': 'No', 'BsmtFin  
'BsmtFinSF1': 569, 'BsmtFinType2': 'Unf', 'BsmtFinSF2': 0, 'BsmtUnfSF': 381,  
'TotalBsmtSF': 950, 'Heating': 'GasA', 'HeatingQC': 'Fa', 'CentralAir': 'Y', 'Electrical':  
'2ndFlrSF': 0, 'LowQualFinSF': 0, 'GrLivArea': 1225, 'BsmtFullBath': 1, 'BsmtHalfBath':  
'HalfBath': 1, 'BedroomAbvGr': 3, 'KitchenAbvGr': 1, 'KitchenQual': 'TA', 'TotRmsAbvGrd'  
'Fireplaces': 0, 'FireplaceQu': np.nan, 'GarageType': np.nan, 'GarageYrBlt': np.nan, 'Gara  
'GarageArea': 0, 'GarageQual': np.nan, 'GarageCond': np.nan, 'PavedDrive': 'Y', 'WoodDeck  
'EnclosedPorch': 0, '3SsnPorch': 0, 'ScreenPorch': 0, 'PoolArea': 0, 'PoolQC': np.nan,

```

```
predicted_price = predict_input(rf2, sample_input)
```

```
print('The predicted sale price of the house is ${}'.format(predicted_price))
```

EXERCISE: Change the sample input above and make predictions. Try different examples and try to figure out which columns have a big impact on the sale price. Hint: Look at the feature importance to decide which columns to try.

Saving the Model

```
import joblib
```

```
house_prices_rf = {  
    'model': rf2,  
    'imputer': imputer,  
    'scaler': scaler,  
    'encoder': encoder,  
    'input_cols': input_cols,  
    'target_col': target_col,  
    'numeric_cols': numeric_cols,  
    'categorical_cols': categorical_cols,  
    'encoded_cols': encoded_cols  
}
```

```
joblib.dump(house_prices_rf, 'house_prices_rf.joblib')
```

Let's save our work before continuing.

```
jovian.commit(outputs=['house_prices_rf.joblib'])
```

Predicting the Logarithm of Sale Price

(OPTIONAL) QUESTION: In the [original Kaggle competition](#), the model is evaluated by computing the Root Mean Squared Error on the logarithm of the sale price. Try training a random forest to predict the logarithm of the sale price, instead of the actual sales price and see if the results you obtain are better than the models trained above.
